

Bugis Theme Documentation

1. Theme-Installation

After downloading the Bugis theme .zip folder on your WordPress blog just log into your WordPress admin panel and go to design / themes. Next to the tab „Manage Themes“ you can find the „Install themes“ tab menu. At the top of the bar, just choose the „upload“ option.

The Bugis theme folder must be in the zip format to upload it via the WordPress admin panel. Just click on the „Install Now“ button to install the theme. After the successful installation you can click on the „Activate“ link to activate Bugis as your current blog theme.

Alternatively, you can also install the theme directly to your server with a FTP client (e.g. Filezilla). Just drop the unzipped Bugis folder into the **wp-content/themes** folder. Now you can see the Bugis theme under available theme in your themes admin panel and you can choose to activate Bugis from here.

2. Theme Options Page

Now you can setting the options for your Bugis theme. On the Theme Options page (**Appearance / Theme Options**) you can find several ways to customize the theme.

You can set your **individual link color** using the Color Picker or by typing in a colors #hex value directly. Also you can choose between the content left, content right or the no sidebar layout option. If you choose the „no sidebar“ layout you can still use widgets (Appearance/Widgets). The widgets will then appear underneath the content area.

You can also upload your own **logo image** (jpg or png) via the theme options page. The size of your logo image should be approximately 300 pixel in width. The height value is optional. Just upload your logo image to the WordPress Media Library using the link on the theme options page. In the media library settings you must copy the file URL of your image, save your settings and paste this URL into the text field of the custom logo image.

If you like you can also upload a **custom favicon** for your blog. Just create 16x16 pixel JPG image and convert it (e.g. with an online favicon generator like faviconr.com) to the.ico file format. Now you just have to upload the favicon.ico file to your Bugis theme folder (e.g. via a FTP program) and paste the favicon URL into the custom favicon text field on the theme options page.

If you like to **change the footer text** in your blog, you can paste your individual footer text into the text area of „Custom Footer text“. You can use HTML code like link text for a link.

3. Custom Menus

Under **Appearance / Menus** in the admin panel you can set up the custom menus for your blog navigation. This WordPress option is very helpful because here you can choose the navigation links of your blog for the main header navigation and the optional footer navigation.

Just create your own custom menus (you can choose any name for your menus) using custom links, pages

or categories. Now you only have to choose your menus as **Primary Navigation** (header) and **Footer Navigation** (if you like an additional navigation in the footer) in the „**Theme Locations**“ field.

The screenshot shows the 'Menus' settings page in the WordPress admin. On the left, under 'Theme Locations', it says 'Your theme supports 2 menus. Select which menu appears in each location.' It has dropdowns for 'Primary Navigation' set to 'Main Menu' and 'Footer Navigation' set to 'Footer Menu'. A 'Save' button is at the bottom. On the right, there's a 'Footer Menu' tab selected, showing a menu structure with 'Main Menu' as the parent and 'Child page 1' and 'Child page 2' as children. There's also a 'Delete Menu' link.

4. Custom background color or image

You can also customize the background of your blog with a different background color or by uploading a custom background image. To do so go to **Appearance / Background** in your WordPress admin panel.

The screenshot shows the 'Custom Background' settings page. It has a preview area showing a light gray background with a subtle pattern. Below it are buttons for 'Remove Image' and 'Upload Image'. The 'Remove Image' button has a note: 'This will remove the background image. You will not be able to restore any customization.' The 'Upload Image' section includes a file input field with 'Datei auswählen' and 'Keine ausgewählt' buttons, and an 'Upload' button.

In Bugis theme folder under images / backgrounds, we prepared 6 light gray background images with different structures you can use as your background image. Of course you can also prepare your own image and upload it via the background settings. Just make sure your image has not a very large file size because this might cause your blog to load very slow into the browser, especially on mobile devices. If you prepare a smaller image (like 100x100px) you can choose the „tile option“ to repeat the image vertically and horizontally.

5. Custom Widgets

To add WordPress widgets to your sidebar go to **Appearance / Widgets** and drag'n'drop the available widgets into the Main Sidebar. In addition, we prepared two custom widgets you can use in the Bugis theme (you can find them also under the Available Widgets). With the **Social Links widget** you can link to your social profiles on Facebook, Twitter, Flickr, YouTube, Google+ and many others. The links will be seen in

your sidebar with nice custom icons (icons designed by Gedy Rivera lifetreecreative.com/icons).

Impor amet, porttitor
ie pulvinar montes proin

In the widget field just add the URLs of the social profiles that you want to use. All the other fields you just leave blank.

The other custom Bugis widget you can select is the **Flickr widget**. In the widgets option you can choose how many pictures you would like to display, whether the images should be of a persons or a Flickr group account and whether you want the latest pictures or a random selection of images to be shown.

You can get your **Flickr ID number** on the website idgettr.com. Copy your Flickr ID and paste it in the widgets option field.

6. Using the post formats

In Bugis theme you can choose the different WordPress post formats **Standard, Aside, Status, Link, Quote, Chat, Image, Gallery, Video or Audio** for your posts. Just choose the post format in the Format field while writing or editing a post.

Move to Trash Update

Format

- Standard
- Aside
- Status
- Link
- Quote
- Chat
- Image
- Gallery
- Video
- Audio

With different post formats your blog layout will look more interesting and your readers can see what kind of content the posts show.

For the display of **quotes** you can use the WordPress text editor button „quote“ or choose the blockquote tag in the HTML editor.

For **Video posts** you can simply select the YouTube or Vimeo embed code and insert it into the Video post. For the **Audio post format** you can use a player widget e.g. from soundcloud.com (like we used in

the Bugis live demo). You can also install an audio player WordPress plugin such as the j-Player to play Audio files right from your blog posts.

Links in the **Link post format** will be shown in a different layout automatically so your users see the link highlighted (see sample post formats posts in the Bugis theme demo).

For the **Gallery post format** you can just upload multiple images via the Image upload option (Upload/Insert). In the „Add an Image“ window you can find the gallery tab. Here you can choose to insert to insert all images of a post into a gallery. The gallery shortcode **[gallery]** will be inserted into your post.

In the live demo of Bugis, we also added the amount of columns for the gallery preview pictures to 4. The gallery shortcode will then look like this:

[gallery columns = „4“]

You can find more options for the WordPress gallery shortcode on the WordPress Codex page:
http://codex.wordpress.org/Gallery_Shortcode

7. Author info on single post page

If you want to show an author description text at the end of every post on single posts pages you only need to fill out the Biographical Info in a User profile. There you can also insert links (in the format link text).

8. Threaded Comments support

Bugis also supports WordPress threaded commenting. Readers will see a reply button for every comment to reply directly. If the button does not show up automatically you might have to enable the threaded comments option under **Settings / Discussion / Other comments options** first.

9. Plugins you could use with the Bugis Theme

To include forms (like a contact form) to your blog, we have prepared special CSS stylings for the **Contact Form 7** plugin.

If you want to include an special archives page for a list of all posts on your blog (like you can see in the Bugis theme demo), you can use the WordPress plugin „**Smart Archives Reloaded**“.

If you want to show code in your articles, you should be possible to use the plugin „**Syntax Highlight Evolved**“. By using the plugin your code snippets will also display correctly on mobile devices.

If you wish to view the latest comments with Gravatar support as you can see in the live demo of Bugis, you can use the „**Better WordPress Recent Comments**“ plugin.

To use the same styling as you see in the Bugis live demo paste the following code into the Plugin option „Template Options“ for the template code:

```
<li class="sidebar-comment">%avatar%<div class="comment-content"><p><span class="sidebar-comment-autor"><a href="%link%" title="%post_title_attr%">%author%</a></span><br />%excerpt%</p></div></li>
```

10. Shortcodes for multicolumn text, info boxes and buttons

You can see a live-demo of the shortcode elements here:

<http://bugis.elmastro.de/fullwidth/>

To set text into **two columns** use the shortcodes in your posts or pages:

[two_columns_one]put your left column text here...[/two_columns_one]

[two_columns_one_last]put your right column text here...[/two_columns_one_last]

[divider]

To set your text into **three columns** use the shortcodes like this:

[three_columns_one]put your left column text here...[/three_columns_one]

[three_columns_one]put your middle column text here...[/three_columns_one]

[three_columns_one_last]put your right column text here...[/three_columns_one_last]

[divider]

To set your text into **four columns** use the shortcodes like this:

[four_columns_one]put your first column text here...[/four_columns_one]

[four_columns_one]put your second column text here...[/four_columns_one]

[four_columns_one]put your third column text here...[/four_columns_one]

[four_columns_one_last]put fourth column text here...[/four_columns_one_last]

[divider]

The **[divider]** shortcode will clear your divs so the columns will not collapse into each other.

For **info boxes (yellow, red or green)** you can use the shortcodes:

[yellow_box]your info text here... [/yellow_box]

[red_box]your info text here... [/red_box]

[green_box]your info text here... [/green_box]

[white_box]your info text here... [/white_box]

[blue_box]your info text here... [/blue_box]

Buttons shortcodes:

[button link="http://sampleurl.com" color="yellow"]Yellow Button Text[/button]

[button link="http://sampleurl.com" color="blue"]Blue Button Text[/button]

[button link="http://sampleurl.com" color="orange"]Orange Button Text[/button]

[button link="http://sampleurl.com" color="red"]Red Button Text[/button]

To open a button link in a new browser tab you also can use **target="blank"** as an option:

[button link="http://sampleurl.com" color="red" target="blank"]Red Button Text[/button]

11. Theme Translation

Bugis is ready for theme translation. Right now there is the default **English and a German** translation available. You can add your own translation or customize an existing translation very easily by using the WordPress plugin »Codestyling Localization«. At the plugins homepage you can also find a detailed plugin description.

12. Child Theme for theme customizations

In case you want to customize the Bugis theme and you therefore have to change the code in the themes styleeheet or any of the theme template files please consider creating a child theme for your changes.

Creating a child theme is very easy and it **saves all your individual changes** from being overwritten by a future update of the Yoko theme. You can find more information on creating a child theme in the WordPress Codex.

To get started you can download a sample child theme folder at the Bugis theme page:

<http://www.elmastudio.de/wordpress-themes/bugis/>

We hope you like the Bugis theme and have lots of fun blogging with it. If you have any questions, problems or suggestions for theme optimizations please contact us by writing a comment on the Bugis theme page or via email to kontakt@elmastudio.de.

Ellen & Manuel from Elmastudio
